Typographical Conventions

Command lines to be typed are shown in typewriter font in a box. For example:

```
cpdf in.pdf -o out.pdf
```

When describing the general form of a command, rather than a particular example, square brackets [ ] are used to enclose optional parts, and angled braces <> to enclose general descriptions which may be substituted for particular instances. For example,

```
cpdf <operation> in.pdf [<range>] -o out.pdf
```

describes a command line which requires an operation and, optionally, a range. An exception is that we use in.pdf and out.pdf instead of <input file> and <output file> to reduce verbosity. Under Microsoft Windows, type cpdf.exe instead of cpdf.
Chapter 1

Basic Usage

The Coherent PDF tools provide a wide range of facilities for modifying PDF files created by other means. There is a single command-line program `cpdf` (*cpdf.exe under Microsoft Windows*). The rest of this manual describes the options that may be given to this program.

### 1.1 Input and Output Files

The typical pattern for usage is

```
cpdf [<operation>] <input file(s)> -o <output file>
```

and the simplest concrete example, assuming the existence of a file `in.pdf` is:

```
cpdf in.pdf -o out.pdf
```

which copies `in.pdf` to `out.pdf`. The input and output may be the same file. Of course, we should like to do more interesting things to the PDF file than that!
Files on the command line are distinguished from other input by their containing a period. If an input file does not contain a period, it should be preceded by `-i`. For example:

```bash
cpdf -i in -o out.pdf
```

A whole directory of files may be added (where a command supports multiple files) by using the `-idir` option:

```bash
cpdf -merge -idir myfiles -o out.pdf
```

The files in the directory `myfiles` are considered in alphabetical order. They must all be PDF files. If the names of the files are numeric, leading zeroes will be required for the order to be correct (e.g. `001.pdf`, `002.pdf` etc).

### 1.2 Input Ranges

An input range may be specified after each input file. This is treated differently by each operation. For instance

```bash
cpdf in.pdf 2-5 out.pdf
```

extracts pages two, three, four and five from `in.pdf`, writing the result to `out.pdf`, assuming that `in.pdf` contains at least five pages. Here are the rules for building input ranges:

- A dash (`-`) defines ranges, e.g. 1-5 or 6-3.
- A comma (`,`) allows one to specify several ranges, e.g. 1-2, 4-5.
- The word `end` represents the last page number.
- The words `odd` and `even` can be used in place of or at the end of a page range to restrict to just the odd or even pages.
- The words `portrait` and `landscape` can be used in place of or at the end of a page range to restrict to just those pages which are portrait or landscape. Note that the meaning of “portrait” and “landscape” does not take account of any viewing rotation in place (use `-upright` first, if required). A page with equal width and height is considered neither portrait nor landscape.
- The word `reverse` is the same as `end-1`.
- The word `all` is the same as `1-end`.
- A range must contain no spaces.
- A tilde (`˜`) defines a page number counting from the end of the document rather than the beginning. Page `˜1` is the last page, `˜2` the penultimate page etc.
For example:

```bash
cpdf in.pdf 1,2,7-end -o out.pdf
```
Remove pages three, four, five and six from a document.

```bash
cpdf in.pdf 1-16odd -o out.pdf
```
Extract the odd pages 1,3,...,13,15.

```bash
cpdf in.pdf landscape -rotate 90 -o out.pdf
```
Rotate all landscape pages by ninety degrees.

```bash
cpdf in.pdf 1,all -o out.pdf
```
Duplicate the front page of a document, perhaps as a fax cover sheet.

```bash
cpdf in.pdf ~3~1 -o out.pdf
```
Extract the last three pages of a document, in order.

### 1.3 Working with Encrypted Documents

In order to perform many operations, encrypted input PDF files must be decrypted. Some require the owner password, some either the user or owner passwords. Either password is supplied by writing `user=<password>` or `owner=<password>` following each input file requiring it (before or after any range). The document will not be re-encrypted upon writing. For example:

```bash
cpdf in.pdf user=charles -info
cpdf in.pdf owner=fred reverse -o out.pdf
```
To re-encrypt the file with its existing encryption upon writing, which is required if only the user password was supplied, but allowed in any case, add the `-recrypt` option:

```bash
cpdf in.pdf user=fred reverse -recrypt -o out.pdf
```
The password required (owner or user) depends upon the operation being performed. Separate facilities are provided to decrypt and encrypt files (See Section 4).

### 1.4 Standard Input and Standard Output

Thus far, we have assumed that the input PDF will be read from a file on disk, and the output written similarly. Often it’s useful to be able to read input from `stdin` (Standard Input) or write output to `stdout` (Standard Output) instead. The typical use is to join several programs
together into a *pipe*, passing data from one to the next without the use of intermediate files. Use `-stdin` to read from standard input, and `-stdout` to write to standard input, either to pipe data between multiple programs, or multiple invocations of the same program. For example, this sequence of commands (all typed on one line)

```
cpdf in.pdf reverse -stdout |
cpdf -stdin 1-5 -stdout |
cpdf -stdin reverse -o out.pdf
```

extracts the last five pages of `in.pdf` in the correct order, writing them to `out.pdf`. It does this by reversing the input, taking the first five pages and then reversing the result.

To supply passwords for a file from `-stdin`, use `-stdin-owner <password>` and/or `-stdin-user <password>`.

Using `-stdout` on the final command in the pipeline to output the PDF to screen is not recommended, since PDF files often contain compressed sections which are not screen-readable.

Several `cpdf` operations write to standard output by default (for example, listing fonts). A useful feature of the command line (not specific to `cpdf`) is the ability to redirect this output to a file. This is achieved with the `>` operator:

```
cpdf -info in.pdf > file.txt
```

Use the `-info` operation (See Section 11.2), redirecting the output to `file.txt`.

### 1.5 Doing Several Things at Once with AND

The keyword AND can be used to string together several commands in one. The advantage compared with using pipes is that the file need not be repeatedly parsed and written out, saving time.

To use AND, simply leave off the output specifier (e.g, `-o`) of one command, and the input specifier (e.g, filename) of the next. For instance:

```
cpdf -merge in.pdf in2.pdf AND -add-text "Label"
   AND -merge in3.pdf -o out.pdf
```

Merge `in.pdf` and `in2.pdf` together, add text to both pages, append `in3.pdf` and write to `out.pdf`.

To specify the range for each section, use `-range`:

```
cpdf -merge in.pdf in2.pdf AND -range 2-4 -add-text "Label"
   AND -merge in3.pdf -o out.pdf
```

Merge `in.pdf` and `in2.pdf` together, add text to pages 2-4, append `in3.pdf` and write to `out.pdf`. 
1.6 Units

When measurements are given to \texttt{cpdf}, they are in points (1 point = 1/72 inch). They may optionally be followed by some letters to change the measurement. The following are supported:

\begin{itemize}
\item \texttt{pt} Points (72 points per inch). The default.
\item \texttt{cm} Centimeters
\item \texttt{mm} Millimeters
\item \texttt{in} Inches
\end{itemize}

For example, one may write \texttt{14mm} or \texttt{21.6in}. In addition, the following letters stand, in some operations (\texttt{-scale-page}, \texttt{-scale-to-fit}, \texttt{-scale-contents}, \texttt{-shift}, \texttt{-mediabox}, \texttt{-crop}) for various page dimensions:

\begin{itemize}
\item \texttt{PW} Page width
\item \texttt{PH} Page height
\item \texttt{PMINX} Page minimum x coordinate
\item \texttt{PMINY} Page minimum y coordinate
\item \texttt{PMAXX} Page maximum x coordinate
\item \texttt{PMAXY} Page maximum y coordinate
\item \texttt{CW} Crop box width
\item \texttt{CH} Crop box height
\item \texttt{CMINX} Crop box minimum x coordinate
\item \texttt{CMINY} Crop box minimum y coordinate
\item \texttt{CMAXX} Crop box maximum x coordinate
\item \texttt{CMAXY} Crop box maximum y coordinate
\end{itemize}

For example, we may write \texttt{PMINX PMINY} to stand for the coordinate of the lower left corner of the page.

Simple arithmetic may be performed using the words \texttt{add}, \texttt{sub}, \texttt{mul} and \texttt{div} to stand for addition, subtraction, multiplication and division. For example, one may write \texttt{14in sub 30pt} or \texttt{PMINX mul 2}

1.7 Setting the Producer and Creator

The \texttt{-producer} and \texttt{-creator} options may be added to any \texttt{cpdf} command line to set the producer and/or creator of the PDF file. If the file was converted from another format, the creator is the program producing the original, the producer the program converting it to PDF.

\begin{verbatim}
cpdf -merge in.pdf in2.pdf -producer MyMerger -o out.pdf
\end{verbatim}

Merge \texttt{in.pdf} and \texttt{in2.pdf}, setting the producer to \texttt{MyMerger} and writing the output to \texttt{out.pdf}. 

1.8 PDF Version Numbers

When an operation which uses a part of the PDF standard which was introduced in a later version than that of the input file, the PDF version in the output file is set to the later version (most PDF viewers will try to load any PDF file, even if it is marked with a later version number). However, this automatic version changing may be suppressed with the -keep-version option. If you wish to manually alter the PDF version of a file, use the -set-version operation described in Section 15.5.

1.9 File IDs

PDF files contain an ID (consisting of two parts), used by some workflow systems to uniquely identify a file. To change the ID, behavior, use the -change-id operation. This will create a new ID for the output file.

```
cpdf -change-id in.pdf -o out.pdf
Write in.pdf to out.pdf, changing the ID.
```

1.10 Linearization

Linearized PDF is a version of the PDF format in which the data is held in a special manner to allow content to be fetched only when needed. This means viewing a multipage PDF over a slow connection is more responsive. By default, cpdf does not linearize output files. To make it do so, add the -l option to the command line, in addition to any other command being used. For example:

```
cpdf -l in.pdf -o out.pdf
Linearize the file in.pdf, writing to out.pdf.
```

This requires the existence of the external program cpdflin which is provided with commercial versions of cpdf. This must be installed as described in the installation documentation provided with your copy of cpdf. If you are unable to install cpdflin, you must use -cpdflin to let cpdf know where to find it:

```
cpdf.exe -cpdflin "C:\\cpdflin.exe" -l in.pdf -o out.pdf
Linearize the file in.pdf, writing to out.pdf.
```

In extremis, you may place cpdflin and its resources in the current working directory, though this is not recommended. For further help, refer to the installation instructions for your copy of cpdf.

To keep the existing linearization status of a file (produce linearized output if the input is linearized and the reverse), use -keep-l instead of -l.
Chapter 1. Basic Usage

1.11 Object Streams

PDF 1.5 introduced a new mechanism for storing objects to save space: object streams. By default, cpdf will preserve object streams in input files, creating no more. To prevent the retention of existing object streams, use \texttt{-no-preserve-objstm}:

\begin{verbatim}
cpdf -no-preserve-objstm in.pdf -o out.pdf
Write the file \textit{in.pdf} to \textit{out.pdf}, removing any object streams.
\end{verbatim}

To create new object streams if none exist, or augment the existing ones, use \texttt{-create-objstm}:

\begin{verbatim}
cpdf -create-objstm in.pdf -o out.pdf
Write the file \textit{in.pdf} to \textit{out.pdf}, preserving any existing object streams, and creating any new ones for new objects which have been added.
\end{verbatim}

To create wholly new object streams, use both options together:

\begin{verbatim}
cpdf -create-objstm -no-preserve-objstm in.pdf -o out.pdf
Write the file \textit{in.pdf} to \textit{out.pdf} with wholly new object streams.
\end{verbatim}

Files written with object streams will be set to PDF 1.5 or higher, unless \texttt{-keep-version} is used (see above).

1.12 Malformed Files

There are many malformed PDF files in existence, including many produced by otherwise-reputable applications. cpdf attempts to correct these problems silently.

Grossly malformed files will be reconstructed. The reconstruction progress is shown on \texttt{stderr} (Standard Error):

\begin{verbatim}
$cpdf in.pdf -o out.pdf
  couldn't lex object number
  Attempting to reconstruct the malformed pdf in.pdf...
  Read 5530 objects
  Malformed PDF reconstruction succeeded!
\end{verbatim}

If \texttt{cpdf} cannot reconstruct a malformed file, it is able to use the \texttt{gs} program to try to reconstruct the program, if you have it installed. For example, if \texttt{gs} is installed and in your path, we might try:
To suppress the output of gs use the -gs-quiet option.

If the malformity lies inside an individual page of the PDF, rather than in its gross structure, cpdf may appear to succeed in reconstruction, only to fail when processing a page (e.g. when adding text). To force the use of gs to pre-process such files so cpdf cannot fail on them, use -gs-malformed-force:

```
  cpdf in.pdf -gs gs -gs-malformed-force -o out.pdf [-gs-quiet]
```

The command line for -gs-malformed-force must be of precisely this form.

Sometimes files can be technically well-formed but use inefficient PDF constructs. If you are sure the input files you are using are impeccably formed, the -fast option added to the command line (or, if using AND, to each section of the command line). This will use certain shortcuts which speed up processing, but would fail on badly-produced files. The -fast option may be used with:

```
Chapter 3
-rotate-contents -upright -vflip -hflip
-shift -scale-page -scale-to-fit -scale-contents
-show-boxes -hard-box -trim-marks

Chapter 8
-add-text -add-rectangle
-stamp-on -stamp-under -combine-pages

Chapter 9
-twoup -twoup-stack
```

If problems occur, refrain from using -fast.

### 1.13 Error Handling

When cpdf encounters an error, it exits with code 2. An error message is displayed on stderr (Standard Error). In normal usage, this means it’s displayed on the screen. When a bad or inappropriate password is given, the exit code is 1.

### 1.14 Control Files

```
cpdf -control <filename>
cpdf -args <filename>
```
Some operating systems have a limit on the length of a command line. To circumvent this, or simply for reasons of flexibility, a control file may be specified from which arguments are drawn. This file does not support the full syntax of the command line. Commands are separated by whitespace, quotation marks may be used if an argument contains a space, and the sequence \" may be used to introduce a genuine quotation mark in such an argument.

Several -control arguments may be specified, and may be mixed in with conventional command-line arguments. The commands in each control file are considered in the order in which they are given, after all conventional arguments have been processed. It is recommended to use -args in all new applications. However, -control will be supported for legacy applications.

To avoid interference between -control and AND, a new mechanism has been added. Using -args in place of -control will perform direct textual substitution of the file into the command line, prior to any other processing.

### 1.15 String Arguments

Command lines are handled differently on each operating system. Some characters are reserved with special meanings, even when they occur inside quoted string arguments. To avoid this problem, cpdf performs processing on string arguments as they are read.

A backslash is used to indicate that a character which would otherwise be treated specially by the command line interpreter is to be treated literally. For example, Unix-like systems attribute a special meaning to the exclamation mark, so the command line

```
cpdf -add-text "Hello!" in.pdf -o out.pdf
```

would fail. We must escape the exclamation mark with a backslash:

```
cpdf -add-text "Hello\!" in.pdf -o out.pdf
```

It follows that backslashes intended to be taken literally must themselves be escaped (i.e. written \\\n).

### 1.16 Text Encodings

Some cpdf commands write text to standard output, or read text from the command line or configuration files. These are:

```
-info
-list-bookmarks
-set-author et al.
-list-annotations
-dump-attachments
```
There are three options to control how the text is interpreted:

- utf8
- stripped
- raw

Add -utf8 to use Unicode UTF8, -stripped to convert to 7 bit ASCII by dropping any high characters, or -raw to perform no processing. The default unless specified in the documentation for an individual operation is -stripped.

### 1.17 Font Embedding

Use the -no-embed-font to avoid embedding the Standard 14 Font metrics when adding text with -add-text.

### 1.18 Creating a new PDF

Cpdf can build a new PDF file, given a number of pages and a paper size. The default is one page, A4 portrait.

```bash
cpdf -create-pdf -create-pdf-pages 20
   -create-pdf-papersize usletterportrait -o out.pdf
```

The standard paper sizes are listed in Section 3.1 or you may specify the width and height directly, as described in the same chapter.
Chapter 2

Merging and Splitting

cpdf -split in.pdf -o <format> [-chunk <chunksize>]
cpdf -split-bookmarks <level> in.pdf -o <format>

2.1 Merging

The -merge operation allow the merging of several files into one. Ranges can be used to select only a subset of pages from each input file in the output. The output file consists of the concatenation of all the input pages in the order specified on the command line. Actually, the -merge can be omitted, since this is the default operation of cpdf.

cpdf -merge a.pdf 1 b.pdf 2-end -o out.pdf
Take page one of a.pdf and all but the first page of b.pdf, merge them and produce out.pdf.

Merge maintains bookmarks, named destinations, and name dictionaries.
Forms and other objects which cannot be merged are retained if they are from the document which first exhibits that feature.
The -retain-numbering option keeps the PDF page numbering labels of each document intact, rather than renumbering the output pages from 1.
The -remove-duplicate-fonts option ensures that fonts used in more than one of the inputs only appear once in the output.
Chapter 2. Merging and Splitting

The -merge-add-bookmarks option adds a top-level bookmark for each file, using the filename. Any existing bookmarks are retained. Adding -merge-add-bookmarks-use-titles will use the title from each PDF’s metadata instead of the filename.

2.2 Splitting

The -split operation splits a PDF file into a number of parts which are written to file, their names being generated from a format. The optional -chunk option allows the number of pages written to each output file to be set.

```
cpdf -split a.pdf -o out%%%.pdf
Split a.pdf to the files out001.pdf, out002.pdf etc.

cpdf -split a.pdf 1 even -chunk 10 -o dir/out%%%.pdf
Split the even pages of a.pdf to the files out001.pdf, out002.pdf etc. with at most ten pages in each file. The directory (folder) dir must exist.
```

If the output format does not provide enough numbers for the files generated, the result is unspecified. The following format operators may be used:

- `%%`, `%%%`, `%%%` etc.: Sequence number padded to the number of percent signs
- `@F`: Original filename without extension
- `@N`: Sequence number without padding zeroes
- `@S`: Start page of this chunk
- `@E`: End page of this chunk
- `@B`: Bookmark name at this page

Numbers padded to a fixed width field by zeroes may be obtained for `@S` and `@E` by following them with more `@` signs e.g. `@E@@@@` for a fixed width of three.

2.3 Splitting on Bookmarks

The -split-bookmarks <level> operation splits a PDF file into a number of parts, according to the page ranges implied by the document’s bookmarks. These parts are then written to file with names generated from the given format.

Level 0 denotes the top-level bookmarks, level 1 the next level (sub-bookmarks) and so on. So -split-bookmarks 1 creates breaks on level 0 and level 1 boundaries.

```
cpdf -split-bookmarks 0 a.pdf -o out%%%.pdf
Split a.pdf to the files out001.pdf, out002.pdf on bookmark boundaries.
```

Now, there may be many bookmarks on a single page (for instance, if paragraphs are bookmarked or there are two subsections on one page). The splits calculated by -split-bookmarks
ensure that each page appears in only one of the output files. It is possible to use the @ operators above, including operator @B which expands to the text of the bookmark:

```
cpdf -split-bookmarks 0 a.pdf -o @B.pdf
```

Split a.pdf on bookmark boundaries, using the bookmark text as the filename.

The bookmark text used for a name is converted from unicode to 7 bit ASCII, and the following characters are removed, in addition to any character with ASCII code less than 32:

```
/ ? < > \ : * | " ^ + =
```

### 2.4 Encrypting with Split and Split Bookmarks

The encryption parameters described in Chapter 4 may be added to the command line to encrypt each split PDF. Similarly, the -recrypt switch described in 1 may by given to re-encrypt each file with the existing encryption of the source PDF.
Chapter 3

Pages

cpdf -scale-page "<scale x> <scale y>" [-fast] in.pdf [<range>] -o out.pdf
cpdf -scale-to-fit "<x size> <y size>" [-fast]
   [-scale-to-fit-scale <scale>]
   in.pdf [<range>] -o out.pdf
cpdf -scale-contents [<scale>] [<position>] [-fast]
   in.pdf [<range>] -o out.pdf
cpdf -shift "<shift x> <shift y>" [-fast] in.pdf [<range>] -o out.pdf
cpdf -rotate <angle> in.pdf [<range>] -o out.pdf
cpdf -rotateby <angle> in.pdf [<range>] -o out.pdf
cpdf -mediabox "<x> <y> <w> <h>" in.pdf [<range>] -o out.pdf
cpdf -cropbox "<x> <y> <w> <h>" in.pdf [<range>] -o out.pdf
cpdf -remove-cropbox in.pdf [<range>] -o out.pdf

(Also bleed, art, and trim versions of these two commands, for example -artbox, -remove-trimbox)
cpdf -frombox <boxname> -tobox <boxname> [-mediabox-if-missing]
   in.pdf [<range>] -o out.pdf
cpdf -hard-box <boxname> [-fast] in.pdf [<range>]
   [-mediabox-if-missing] -o out.pdf
3.1 Page Sizes

Any time when a page size is required, instead of writing, for instance "210mm 197mm" one can instead write a4portrait. Here is a list of supported page sizes:

- a0portrait
- a1portrait
- a2portrait
- a3portrait
- a4portrait
- a5portrait
- a6portrait
- a7portrait
- a8portrait
- a9portrait
- a10portrait
- a0landscape
- a1landscape
- a2landscape
- a3landscape
- a4landscape
- a5landscape
- a6landscape
- a7landscape
- a8landscape
- a9landscape
- a10landscape
- usletterportrait
- usletterlandscape
- uslegalportrait
- uslegallandscape

3.2 Scale Pages

The -scale-page operation scales each page in the range by the X and Y factors given. This scales both the page contents, and the page size itself. It also scales any Crop Box and other boxes (Art Box, Trim Box etc). As with several of these commands, remember to take into account any page rotation when considering what the X and Y axes relate to.

```
cpdf -scale-page "2 2" in.pdf -o out.pdf
```
Convert an A4 page to A3, for instance.

The -scale-to-fit operation scales each page in the range to fit a given page size, preserving aspect ratio and centering the result.

```
cpdf -scale-to-fit "297mm 210mm" in.pdf -o out.pdf
cpdf -scale-to-fit a4portrait in.pdf -o out.pdf
```
Scale a file’s pages to fit A4 portrait.

The scale can optionally be set to a percentage of the available area, instead of filling it.

```
cpdf -scale-to-fit a4portrait -scale-to-fit-scale 0.9 in.pdf -o out.pdf
```
Scale a file’s pages to fit A4 portrait, scaling the page 90% of its possible size.

NB: -scale-to-fit operates with respect to the media box not the crop box. If necessary, set the media box to be equal to the crop box first. In addition, -scale-to-fit presently requires that the origin of the media box be (0, 0). This can be assured by preprocessing with -upright.
The \texttt{-scale-contents} operation scales the contents about the center of the crop box (or, if absent, the media box), leaving the page dimensions (boxes) unchanged.

\begin{verbatim}
cpdf -scale-contents 0.5 in.pdf -o out.pdf
Scale a file's contents on all pages to 50\% of its original dimensions.
\end{verbatim}

To scale about a point other than the center, one can use the positioning commands described in Section \ref{Sec:Positioning}. For example:

\begin{verbatim}
cpdf -scale-contents 0.5 -topright 20 in.pdf -o out.pdf
Scale a file's contents on all pages to 50\% of its original dimensions about a point 20pts from its top right corner.
\end{verbatim}

### 3.3 Shift Page Contents

The \texttt{-shift} operation shifts the contents of each page in the range by \texttt{X} points horizontally and \texttt{Y} points vertically.

\begin{verbatim}
cpdf -shift "50 0" in.pdf even -o out.pdf
Shift pages to the right by 50 points (for instance, to increase the binding margin).
\end{verbatim}

### 3.4 Rotating Pages

There are two ways of rotating pages: (1) setting a value in the PDF file which asks the viewer (e.g. Acrobat) to rotate the page on-the-fly when viewing it (use \texttt{-rotate} or \texttt{-rotateby}) and (2) actually rotating the page contents and/or the page dimensions (use \texttt{-upright} afterwards or \texttt{-rotate-contents} to just rotate the page contents).

The possible values for \texttt{-rotate} and \texttt{-rotate-by} are 0, 90, 180 and 270, all interpreted as being clockwise. Any value may be used for \texttt{-rotate-contents}.

The \texttt{-rotate} operation sets the viewing rotation of the selected pages to the absolute value given.

\begin{verbatim}
cpdf -rotate 90 in.pdf -o out.pdf
Set the rotation of all the pages in the input file to ninety degrees clockwise.
\end{verbatim}

The \texttt{-rotateby} operation changes the viewing rotation of all the given pages by the relative value given.
The \texttt{-rotate-contents} operation rotates the contents and dimensions of the page by the given relative value.

```
cpdf -rotate-contents 90 in.pdf -o out.pdf

Rotate all the page contents in the input file by ninety degrees clockwise. Does not change the page dimensions.
```

The \texttt{-upright} operation does whatever combination of \texttt{-rotate} and \texttt{-rotate-contents} is required to change the rotation of the document to zero without altering its appearance. In addition, it makes sure the media box has its origin at (0,0), changing other boxes to compensate. This is important because some operations in CPDF (such as scale-to-fit), and in other PDF-processing programs, work properly only when the origin is (0, 0).

### 3.5 Flipping Pages

The \texttt{-hflip} and \texttt{-vflip} operations flip the contents of the chosen pages horizontally or vertically. No account is taken of the current page rotation when considering what “horizontally” and “vertically” mean, so you may like to use \texttt{-upright} first.

```
cpdf -hflip in.pdf even -o out.pdf
Flip the even pages in \texttt{in.pdf} horizontally.

cpdf -vflip in.pdf -o out.pdf
Flip all the pages in \texttt{in.pdf} vertically.
```

### 3.6 Boxes and Cropping

All PDF files contain a \textit{media box} for each page, giving the dimensions of the paper. To change these dimensions (without altering the page contents in any way), use the \texttt{-mediabox} operation.

```
cpdf -mediabox "0pt 0pt 500pt 500pt" in.pdf -o out.pdf
Set the media box to 500 points square.
```

The four numbers are minimum x, minimum y, width, height. x coordinates increase to the right, y coordinates increase upwards. PDF file can also optionally contain a \textit{crop box} for each
page, defining to what extent the page is cropped before being displayed or printed. A crop box can be set, changed and removed, without affecting the underlying media box. To set or change the crop box use -cropbox. To remove any existing crop box, use -remove-cropbox.

```bash
cpdf -cropbox "0pt 0pt 200mm 200mm" in.pdf -o out.pdf
```
Crop pages to the bottom left 200-millimeter square of the page.

```bash
cpdf -remove-cropbox in.pdf -o out.pdf
```
Remove cropping.

Note that the crop box is only obeyed in some viewers. Similar operations are available for the bleed, art, and trim boxes (-art, -remove-bleed etc.)

```bash
```
Copy the contents of one box to another.

This operation copies the contents of one box (Media box, Crop box, Trim box etc.) to another. If -mediabox-if-missing is added, the media box will be substituted when the ‘from’ box is not set for a given page. For example

```bash
cpdf -frombox /TrimBox -tobox /CropBox in.pdf -o out.pdf
```
copies the Trim Box of each page to the Crop Box of each page. The possible boxes are /MediaBox, /CropBox, /BleedBox, /TrimBox, /ArtBox.

A hard box (one which clips its contents by inserting a clipping rectangle) may be created with the -hard-box operation:

```bash
cpdf -hard-box /TrimBox in.pdf -o out.pdf
```
This means the resultant file may be used as a stamp without contents outside the given box reappearing. The -mediabox-if-missing option may also be used here.

### 3.7 Showing Boxes and Printer’s Marks

The -show-boxes operation displays the boxes present on each page as method of debugging. Since boxes may be coincident, they are shown in differing colours and dash patterns so they may be identified even where they overlap. The colours are:

- Media box Red
- Crop box Green
- Art box Blue
- Trim box Orange
- Bleed box Pink
The `trim-marks` operation adds trim marks to a PDF file. The trim box must be present.
Chapter 4

Encryption and Decryption

```plaintext
cpdf -encrypt <method> <owner> <user>
  [-no-encrypt-metadata] <permissions> in.pdf -o out.pdf
cpdf -decrypt in.pdf owner=<owner password> -o out.pdf
```

4.1 Introduction

PDF files can be encrypted using various types of encryption and attaching various permissions describing what someone can do with a particular document (for instance, printing it or extracting content). There are two types of person:

The **User** can do to the document what is allowed in the permissions.

The **Owner** can do anything, including altering the permissions or removing encryption entirely.

There are five kinds of encryption:

- 40-bit encryption (method `40bit`) in Acrobat 3 (PDF 1.1) and above
- 128-bit encryption (method `128bit`) in Acrobat 5 (PDF 1.4) and above
- 128-bit AES encryption (method `AES`) in Acrobat 7 (PDF 1.6) and above
- 256-bit AES encryption (method `AES256`) in Acrobat 9 (PDF 1.7) – *this is deprecated – do not use for new documents*
- 256-bit AES encryption (method `AES256ISO`) in PDF 2.0

All encryption supports these kinds of permissions:

- `-no-edit` Cannot change the document
- `-no-print` Cannot print the document
- `-no-copy` Cannot select or copy text or graphics
- `-no-annot` Cannot add or change form fields or annotations
In addition, 128-bit encryption (Acrobat 5 and above) and AES encryption supports these:
- no-forms Cannot edit form fields
- no-extract Cannot extract text or graphics
- no-assemble Cannot merge files etc.
- no-hq-print Cannot print high-quality

Add these options to the command line to prevent each operation.

### 4.2 Encrypting a Document

To encrypt a document, the owner and user passwords must be given (here, *fred* and *charles* respectively):

```
cpdf -encrypt 40bit fred charles -no-print in.pdf -o out.pdf
cpdf -encrypt 128bit fred charles -no-extract in.pdf -o out.pdf
cpdf -encrypt AES fred "" -no-edit -no-copy in.pdf -o out.pdf
```

A blank user password is common. In this event, PDF viewers will typically not prompt for a password for when opening the file or for operations allowable with the user password.

```
cpdf -encrypt AES256 fred "" -no-forms in.pdf -o out.pdf
```

In addition, the usual method can be used to give the existing owner password, if the document is already encrypted.

When using AES encryption, the option is available to refrain from encrypting the metadata. Add `-no-encrypt-metadata` to the command line.

### 4.3 Decrypting a Document

To decrypt a document, the owner password is provided.

```
cpdf -decrypt in.pdf owner=fred -o out.pdf
```

The user password cannot decrypt a file.
Chapter 5

Compression

cpdf -decompress in.pdf -o out.pdf
cpdf -compress in.pdf -o out.pdf
cpdf -squeeze in.pdf [-squeeze-log-to <filename>] -o out.pdf

cpdf provides basic facilities for decompressing and compressing PDF streams, and for repro-
cessing the whole file to ‘squeeze’ it.

5.1 Decompressing a Document

To decompress the streams in a PDF file, for instance to manually inspect the PDF, use:

cpdf -decompress in.pdf -o out.pdf

If cpdf finds a compression type it can’t cope with, the stream is left compressed. When using
-decompress, object streams are not compressed. It may be easier for manual inspection to
also remove object streams, by adding the -no-preserve-objstm option to the command.

5.2 Compressing a Document

To compress the streams in a PDF file, use:

cpdf -compress in.pdf -o out.pdf

cpdf compresses any streams which have no compression using the FlateDecode method, with
the exception of Metadata streams, which are left uncompressed.
5.3 Squeezing a Document

To *squeeze* a PDF file, reducing its size by an average of about twenty percent (though sometimes not at all), use:

```
cpdf -squeeze in.pdf -o out.pdf
```

Adding `-squeeze` to the command line when using another operation will *squeeze* the file or files upon output.

The `-squeeze` operation writes some information about the squeezing process to standard output. The squeezing process involves several processes which losslessly attempt to reduce the file size. It is slow, so should not be used without thought.

```
$ ./cpdf -squeeze in.pdf -o out.pdf
Initial file size is 238169 bytes
Beginning squeeze: 123847 objects
Squeezing... Down to 114860 objects
Squeezing... Down to 114842 objects
Squeezing page data
Recompressing document
Final file size is 187200 bytes, 78.60% of original.
```

The `-squeeze-log-to <filename>` option writes the log to the given file instead of to standard output. Log contents is appended to the end of the log file, preserving existing contents.
PDF Bookmarks (properly called the document outline) represent a tree of references to parts of the file, typically displayed at the side of the screen. The user can click on one to move to the specified place. \texttt{cpdf} provides facilities to list, add, and remove bookmarks. The format used by the list and add operations is the same, so you can feed the output of one into the other, for instance to copy bookmarks.

### 6.1 List Bookmarks

The \texttt{-list-bookmarks} operation prints (to standard output) the bookmarks in a file. The first column gives the level of the tree at which a particular bookmark is. Then the text of the bookmark in quotes. Then the page number which the bookmark points to. Then (optionally) the word "open" if the bookmark should have its children (at the level immediately below) visible when the file is loaded. Then the destination (see below). For example, upon executing

\begin{verbatim}
cpdf -list-bookmarks doc.pdf
\end{verbatim}

the result might be:

\begin{verbatim}
0 "Part 1" 1 open
1 "Part 1A" 2 ":[2 /XYZ 200 400 null]"
1 "Part 1B" 3
\end{verbatim}
If the page number is 0, it indicates that clicking on that entry doesn’t move to a page.

By default, `cpdf` converts unicode to ASCII text, dropping characters outside the ASCII range. To prevent this, and return unicode UTF8 output, add the `-utf8` option to the command. To prevent any processing, use the `-raw` option. See Section 1.16 for more information.

### 6.1.1 Destinations

The destination is an extended description of where the bookmark should point to (i.e. it can be more detailed than just giving the page). For example, it may point to a section heading halfway down a page. Here are the possibilities:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{ p /XYZ left top zoom}</code></td>
<td>Display page number <code>p</code> with <code>left</code>, <code>top</code> positioned at upper-left of window and magnification of <code>zoom</code>. Writing “null” for any of <code>left</code>, <code>top</code>, or <code>zoom</code> specifies no change. A <code>zoom</code> of 0 is the same as “null”.</td>
</tr>
<tr>
<td><code>{ p /Fit}</code></td>
<td>Display page number <code>p</code> so as to fit fully within the window.</td>
</tr>
<tr>
<td><code>{ p /FitH top}</code></td>
<td>Display page number <code>p</code> with vertical coordinate <code>top</code> at the top of the window and the page magnified so its width fits the window. A <code>top</code> of 0 implies no change.</td>
</tr>
<tr>
<td><code>{ p /FitV left}</code></td>
<td>Display page number <code>p</code> with horizontal coordinate <code>left</code> at the left of the window, and the page magnified so its height fits the window. A null value for <code>left</code> implies no change.</td>
</tr>
<tr>
<td><code>{ p /FitR left bottom right top}</code></td>
<td>Display page number <code>p</code> magnified so as to fit entirely within the rectangle specified by the other parameters.</td>
</tr>
<tr>
<td><code>{ p /FitB}</code></td>
<td>As for <code>/Fit</code> but with the page’s bounding box (see below).</td>
</tr>
<tr>
<td><code>{ p /FitBH top}</code></td>
<td>As for <code>/FitH</code> but with the page’s bounding box (see below).</td>
</tr>
<tr>
<td><code>{ p /FitBV left}</code></td>
<td>As for <code>/FitV</code> but with the page’s bounding box (see below).</td>
</tr>
</tbody>
</table>

The bounding box is the intersection of the page’s crop box and the bounding box of the page contents. Some other kinds of destination may be produced by `-list-bookmarks`. They will be preserved by `-add-bookmarks` and may be edited as your risk.
6.2 Remove Bookmarks

The `-remove-bookmarks` operation removes all bookmarks from the file.

```
cpdf -remove-bookmarks in.pdf -o out.pdf
```

6.3 Add Bookmarks

The `-add-bookmarks` file adds bookmarks as specified by a `bookmarks file`, a text file in ASCII or UTF8 encoding and in the same format as that produced by the `-list-bookmarks` operation. If there are any bookmarks in the input PDF already, they are discarded. For example, if the file `bookmarks.txt` contains the output from `-list-bookmarks` above, then the command

```
cpdf -add-bookmarks bookmarks.txt in.pdf -o out.pdf
```

adds the bookmarks to the input file, writing to `out.pdf`. An error will be given if the bookmarks file is not in the correct form (in particular, the numbers in the first column which specify the level must form a proper tree with no entry being more than one greater than the last).

6.4 Opening bookmarks

As an alternative to extracting a bookmark file and manipulating the open-status of bookmarks, mass manipulation may be achieved by the following operation:

```
cpdf -bookmarks-open-to-level <level> in.pdf -o out.pdf
```

A level of 0 will close all bookmarks, level 1 will open just the top level, closing all others etc. To open all of them, pick a sufficiently large level.
Chapter 7

Presentations

The PDF file format, starting at Version 1.1, provides for simple slide-show presentations in the manner of Microsoft Powerpoint. These can be played in Acrobat and possibly other PDF viewers, typically started by entering full-screen mode. The \texttt{-presentation} operation allows such a presentation to be built from any PDF file.

The \texttt{-trans} option chooses the transition style. When a page range is used, it is the transition \textit{from} each page named which is altered. The following transition styles are available:

\textbf{Split} Two lines sweep across the screen, revealing the new page. By default the lines are horizontal. Vertical lines are selected by using the \texttt{-vertical} option.

\textbf{Blinds} Multiple lines sweep across the screen, revealing the new page. By default the lines are horizontal. Vertical lines are selected by using the \texttt{-vertical} option.

\textbf{Box} A rectangular box sweeps inward from the edges of the page. Use \texttt{-outward} to make it sweep from the center to the edges.

\textbf{Wipe} A single line sweeps across the screen from one edge to the other in a direction specified by the \texttt{-direction} option.

\textbf{Dissolve} The old page dissolves gradually to reveal the new one.

\textbf{Glitter} The same as \textbf{Dissolve} but the effect sweeps across the page in the direction specified by the \texttt{-direction} option.
To remove a transition style currently applied to the selected pages, omit the \texttt{-trans} option.

The \texttt{-effect-duration} option specifies the length of time in seconds for the transition itself. The default value is one second.

The \texttt{-duration} option specifies the maximum time in seconds that the page is displayed before the presentation automatically advances. The default, in the absence of the \texttt{-duration} option, is for no automatic advancement.

The \texttt{-direction} option (for \texttt{Wipe} and \texttt{Glitter} styles only) specifies the direction of the effect. The following values are valid:

- \texttt{0} Left to right
- \texttt{90} Bottom to top (\texttt{Wipe} only)
- \texttt{180} Right to left (\texttt{Wipe} only)
- \texttt{270} Top to bottom
- \texttt{315} Top-left to bottom-right (\texttt{Glitter} only)

For example:

\begin{verbatim}
  cpdf -presentation in.pdf 2-end -trans Split -duration 10 -o out.pdf
\end{verbatim}

The \texttt{Split} style, with vertical lines, and each slide staying ten seconds unless manually advanced. The first page (being a title) does not move on automatically, and has no transition effect.

To use different options on different page ranges, run \texttt{cpdf} multiple times on the file using a different page range each time.
Chapter 8

Watermarks and Stamps

```
cpdf -stamp-on source.pdf  
   [-scale-stamp-to-fit] [<positioning command>] [-relative-to-cropbox] 

cpdf -stamp-under source.pdf  
   [-scale-stamp-to-fit] [<positioning command>] [-relative-to-cropbox] 

cpdf ([-add-text <text-format> | -add-rectangle <size>])  
   [-font <fontname>]  
   [-font-size <size-in-points>]  
   [-color <color>]  
   [-line-spacing <number>]  
   [-outline]  
   [-linewidth <number>]  
   [-underneath]  
   [-relative-to-cropbox]  
   [-prerotate]  
   [-bates <number>]  
   [-bates-at-range <number>]  
   [-bates-pad-to <number>]  
   [-opacity <number>]  
   [-midline]  
   [-topline]  
   [-fast]  
   in.pdf [<range>] -o out.pdf
```

See also positioning commands below.

```
cpdf -remove-text in.pdf [<range>] -o out.pdf
```

NB: See discussion of `-fast` in Section 1.12.
8.1 Add a Watermark or Logo

The `-stamp-on` and `-stamp-under` operations stamp the first page of a source PDF onto or under each page in the given range of the input file. For example,

```
cpdf -stamp-on logo.pdf in.pdf odd -o out.pdf
```

stamps the file `logo.pdf` onto the odd pages of `in.pdf`, writing to `out.pdf`. A watermark should go underneath each page:

```
cpdf -stamp-under topsecret.pdf in.pdf -o out.pdf
```

The position commands in Section 8.2.4 can be used to locate the stamp more precisely (they are calculated relative to the crop box of the stamp). Or, preprocess the stamp with `-shift` first.

The `-scale-stamp-to-fit` option can be added to scale the stamp to fit the page before applying it. The use of positioning commands together with `-scale-stamp-to-fit` is not recommended.

The `-combine-pages` operation takes two PDF files and stamps each page of one over each page of the other. The length of the output is the same as the length of the “under” file. For instance:

```
cpdf -combine-pages over.pdf under.pdf -o out.pdf
```

Page attributes (such as the display rotation) are taken from the “under” file. For best results, remove any rotation differences in the two files using `-upright` first.

The `-relative-to-cropbox` option takes the positioning command to be relative to the crop box of each page rather than the media box.

8.2 Stamp Text, Dates and Times.

The `-add-text` operation allows text, dates and times to be stamped over one or more pages of the input at a given position and using a given font, font size and color.

```
cpdf -add-text "Copyright 2014 ACME Corp." in.pdf -o out.pdf
```

The default is black 12pt Times New Roman text in the top left of each page. The text can be placed underneath rather than over the page by adding the `-underneath` option.

Text previously added by `cpdf` may be removed by the `-remove-text` operation.

```
cpdf -remove-text in.pdf -o out.pdf
```
8.2.1 Page Numbers

There are various special codes to include the page number in the text:

- %Page: Page number in arabic notation (1, 2, 3…)
- %PageDiv2: Page number in arabic notation divided by two
- %roman: Page number in lower-case roman notation (i, ii, iii…)
- %Roman: Page number in upper-case roman notation (I, II, III…)
- %EndPage: Last page of document in arabic notation
- %Label: The page label of the page
- %EndLabel: The page label of the last page
- %filename: The full file name of the input document

For example, the format "Page %Page of %EndPage" might become "Page 5 of 17".

NB: In some circumstances (e.g. in batch files) on Microsoft Windows, % is a special character, and must be escaped (written as %%). Consult your local documentation for details.

8.2.2 Date and Time Formats

- %a: Abbreviated weekday name (Sun, Mon etc.)
- %A: Full weekday name (Sunday, Monday etc.)
- %b: Abbreviated month name (Jan, Feb etc.)
- %B: Full month name (January, February etc.)
- %d: Day of the month (01–31)
- %e: Day of the month (1–31)
- %H: Hour in 24-hour clock (00–23)
- %I: Hour in 12-hour clock (01–12)
- %j: Day of the year (001–366)
- %m: Month of the year (01–12)
- %M: Minute of the hour (00–59)
- %p: "a.m" or "p.m"
- %S: Second of the minute (00–61)
- %T: Same as %H:%M:%S
- %u: Weekday (1–7, 1 = Monday)
- %w: Weekday (0–6, 0 = Monday)
- %Y: Year (0000–9999)
- %%: The % character.

8.2.3 Bates Numbers

Unique page identifiers can be specified by putting %Bates in the format. The starting point can be set with the -bates option. For example:

```
cpdf -add-text "Page ID: %Bates" -bates 23745 in.pdf -o out.pdf
```

To specify that bates numbering begins at the first page of the range, use -bates-at-range instead. This option must be specified after the range is specified. To pad the bates number
up to a given number of leading zeros, use \texttt{-bates-pad-to} in addition to either \texttt{-bates} or \texttt{-bates-at-range}.

8.2.4 Position

The position of the text may be specified either in absolute terms:

- \texttt{-pos-center "200 200"}
  Position the center of the baseline text at (200pt, 200pt)
- \texttt{-pos-left "200 200"}
  Position the left of the baseline of the text at (200pt, 200pt)
- \texttt{-pos-right "200 200"}
  Position the right of the baseline of the text at (200pt, 200pt)

Positions relative to certain common points can be set:

- \texttt{-top 10}
  Center of baseline 10 pts down from the top center
- \texttt{-topleft 10}
  Left of baseline 10 pts down and in from top left
- \texttt{-topright 10}
  Right of baseline 10 pts down and left from top right
- \texttt{-left 10}
  Left of baseline 10 pts in from center left
- \texttt{-bottomleft 10}
  Left of baseline 10 pts in and up from bottom left
- \texttt{-bottom 10}
  Center of baseline 10 pts up from bottom center
- \texttt{-bottomright 10}
  Right of baseline 10 pts up and in from bottom right
- \texttt{-right 10}
  Right of baseline 10 pts in from the center right
- \texttt{-diagonal}
  Diagonal, bottom left to top right, centered on page
- \texttt{-reverse-diagonal}
  Diagonal, top left to bottom right, centered on page
- \texttt{-center}
  Centered on page

No attempt is made to take account of the page rotation when interpreting the position, so \texttt{-prerotate} must be added to the command line if the file contains pages with a non-zero viewing rotation. This is equivalent to pre-processing the document with \texttt{-upright}.

The \texttt{-relative-to-cropbox} modifier can be added to the command line to make these measurements relative to the crop box instead of the media box.

The default position is equivalent to \texttt{-topleft 100}.

The \texttt{-midline} option may be added to specify that the positioning commands above are to be considered relative to the midline of the text, rather than its baseline. Similarly, the \texttt{-topline} option may be used to specify that the position is taken relative to the top of the text.

8.2.5 Font and Size

The font may be set with the \texttt{-font} option. The 14 Standard PDF fonts are available:
For example, page numbers in Times Italic can be achieved by:

```
cpdf -add-text "-%Page-" -font "Times-Italic" in.pdf -o out.pdf
```

See Section 14.2 for how to use other fonts. The font size can be altered with the `-font-size` option, which specifies the size in points:

```
cpdf -add-text "-%Page-" -font-size 36 in.pdf -o out.pdf
```

### 8.2.6 Colors

The `-color` option takes an RGB color, where red, green and blue components range between 0 and 1. The following values are predefined:

<table>
<thead>
<tr>
<th>Color</th>
<th>R, G, B</th>
</tr>
</thead>
<tbody>
<tr>
<td>white</td>
<td>1, 1, 1</td>
</tr>
<tr>
<td>black</td>
<td>0, 0, 0</td>
</tr>
<tr>
<td>red</td>
<td>1, 0, 0</td>
</tr>
<tr>
<td>green</td>
<td>0, 1, 0</td>
</tr>
<tr>
<td>blue</td>
<td>0, 0, 1</td>
</tr>
</tbody>
</table>

```
cpdf -add-text "Hullo" -color "red" in.pdf -o out.pdf
```
```
cpdf -add-text "Hullo" -color "0.5 0.5 0.5" in.pdf -o out.pdf
```

Partly-transparent text may be specified using the `-opacity` option. Wholly opaque is 1 and wholly transparent is 0. For example:

```
cpdf -add-text "DRAFT" -color "red" -opacity 0.3 -o out.pdf
```
8.2.7 Outline Text

The \texttt{-outline} option sets outline text. The line width (default 1pt) may be set with the \texttt{-linewidth} option. For example, to stamp documents as drafts:

\begin{verbatim}
cpdf -add-text "DRAFT" -diagonal -outline in.pdf -o out.pdf
\end{verbatim}

8.2.8 Multi-line Text

The code \texttt{\textbackslash n} can be included in the text string to move to the next line. In this case, the vertical position refers to the baseline of the first line of text (if the position is at the top, top left or top right of the page) or the baseline of the last line of text (if the position is at the bottom, bottom left or bottom right).

\begin{verbatim}
cpdf -add-text "Specification\n%Page of %EndPage"
    -topright 10 in.pdf -o out.pdf
\end{verbatim}

The \texttt{-midline} option may be used to make these vertical positions relative to the midline of a line of text rather than the baseline, as usual.

The \texttt{-line-spacing} option can be used to increase or decrease the line spacing, where a spacing of 1 is the standard.

\begin{verbatim}
cpdf -add-text "Specification\n%Page of %EndPage"
    -topright 10 -line-spacing 1.5 in.pdf -o out.pdf
\end{verbatim}

Justification of multiple lines is handled by the \texttt{-justify-left}, \texttt{-justify-right} and \texttt{-justify-center} options. The defaults are left justification for positions relative to the left hand side of the page, right justification for those relative to the right, and center justification for positions relative to the center of the page. For example:

\begin{verbatim}
cpdf -add-text "Long line\nShort" -justify-right
    in.pdf -o out.pdf
\end{verbatim}

8.2.9 Special Characters

If your command line allows for the inclusion of unicode characters, the input text will be considered as UTF8 by \texttt{cpdf}. Special characters which exist in the PDF WinAnsiEncoding Latin
1 code (such as many accented characters) will be reproduced in the PDF. This does not mean, however, that every special character can be reproduced. You must experiment.

For compatibility with previous versions of cpdf, special characters may be introduced manually with a backslash followed by the three-digit octal code of the character in the PDF WinAnsiEncoding Latin 1 Code. The full table is included in Appendix D of the Adobe PDF Reference Manual, which is available at [http://www.adobe.com/devnet/pdf/pdf_reference.html](http://www.adobe.com/devnet/pdf/pdf_reference.html).

For example, a German sharp s (ß) may be introduced by \337.

### 8.3 Stamping Graphics

A rectangle may be placed on one or more pages by using the `-add-rectangle <size>` command. Most of the options discussed above for text placement apply in the same way. For example:

```bash
cpdf -add-rectangle "200 300" -pos-right 30 -color red -outline in.pdf -o out.pdf
```

This can be used to blank out or highlight part of the document. The following positioning options work as you would expect: `-topleft`, `-top`, `-topright`, `-right`, `-bottomright`, `-bottom`, `-bottomleft`, `-left`, `-center`. When using the option `-pos-left "x y"`, the point (x, y) refers to the bottom-left of the rectangle. When using the option `-pos-right "x y"`, the point (x, y) refers to the bottom-right of the rectangle. When using the option `-pos-center "x y"`, the point (x, y) refers to the center of the rectangle. The options `-diagonal` and `-reverse-diagonal` have no meaning.
Chapter 9

Multipage Facilities

9.1 Two-up

This facility puts multiple logical pages on a single physical page. The `twoup-stack` operation puts two logical pages on each physical page, rotating them 90 degrees to do so. The new mediabox is thus larger. The `twoup` operation does the same, but scales the new sides down so that the media box is unchanged.

NB: See discussion of `fast` in Section 1.12.

9.2 Inserting Blank Pages

Sometimes, for instance to get a printing arrangement right, it’s useful to be able to insert blank pages into a PDF file. `cpdf` can add blank pages before a given page or pages, or after. The pages in question are specified by a range in the usual way:

```plaintext
cpdf -pad-before in.pdf 1 -o out.pdf
Add a blank page before page 1 (i.e. at the beginning of the document.)

cpdf -pad-after in.pdf 2,16,38,84,121,147 -o out.pdf
```
Chapter 9. Multipage Facilities

Add a blank page after pages 2, 16, 38, 84, 121 and 147 (for instance, to add a clean page between chapters of a document.)

The dimensions of the padded page are derived from the boxes (media box, crop box etc.) of the page after or before which the padding is to be applied.

The -pad-every n operation places a blank page after every n pages, excluding any last one. For example...

```
cpdf -pad-every 3 in.pdf -o out.pdf
```

Add a blank page after every three pages

... on a 9 page document adds a blank page after pages 3 and 6.

In all three of these operations, one may specify -pad-with providing a (usually one-page) PDF file to be used instead of a blank page. For example, a page saying "This page left intentionally blank".

The -pad-multiple n operation adds blank pages so the document has a multiple of n pages. For example:

```
cpdf -pad-multiple 8 in.pdf -o out.pdf
```

Add blank pages to in.pdf so it has a multiple of 8 pages.

The -pad-multiple-before n operation adds the padding pages at the beginning of the file instead.
Chapter 10

Annotations

`cpdf -list-annotations in.pdf [<range>]`
`cpdf -copy-annotations from.pdf to.pdf [<range>] -o out.pdf`
`cpdf -remove-annotations in.pdf [<range>] -o out.pdf`

10.1 List Annotations

The `-list-annotations` operation prints the textual content of any annotations on the selected pages to standard output. Each annotation is preceded by the page number and followed by a newline. See Section 1.16 for more information on text encodings in the output of this operation.

```
`cpdf -list-annotations in.pdf > annots.txt`
```

Print annotations from `in.pdf`, redirecting output to `annots.txt`.

10.2 Copy Annotations

The `-copy-annotations` operation copies the annotations in the given page range from one file (the file specified immediately after the option) to another pre-existing PDF. The range is specified after this pre-existing PDF. The result is then written an output file, specified in the usual way.

```
`cpdf -copy-annotations from.pdf to.pdf 1-10 -o result.pdf`
```

Copy annotations from the first ten pages of `from.pdf` onto the PDF file `to.pdf`, writing the result to `results.pdf`. 
10.3 Remove Annotations

The `-remove-annotations` operation removes all annotations from the given page range.

```
cpdf -remove-annotations in.pdf 1 -o out.pdf
```

Remove annotations from the first page of a file only.
Chapter 11

Document Information and Metadata

cpdf -list-fonts in.pdf
cpdf -info [-raw | -utf8] in.pdf
cpdf -page-info in.pdf
cpdf -pages in.pdf
cpdf -set-title <title of document>
(Also -set-author etc. See Section 11.3)
cpdf -set-page-layout <layout> in.pdf -o out.pdf
cpdf -set-page-mode <mode> in.pdf -o out.pdf
cpdf -hide-toolbar <true | false> in.pdf -o out.pdf
  -hide-menubar
  -hide-window-ui
  -fit-window
  -center-window
  -display-doc-title

cpdf -open-at-page <page number> in.pdf -o out.pdf
cpdf -open-at-page-fit <page number> in.pdf -o out.pdf
cpdf -set-metadata <metadata-file> in.pdf -o out.pdf
cpdf -remove-metadata in.pdf -o out.pdf
cpdf -print-metadata in.pdf
cpdf -create-metadata in.pdf -o out.pdf
cpdf -set-metadata-date <date> in.pdf -o out.pdf
cpdf -add-page-labels in.pdf -o out.pdf
  [-label-style <style>] [-label-prefix <string>]
  [-label-startval <integer>]

43
11.1 Listing Fonts

The `list-fonts` operation prints the fonts in the document, one-per-line to standard output. For example:

```
1 /F245 /Type0 /ClearGothic-Bold /Identity-H
1 /F247 /Type0 /ClearGothicSerialLight /Identity-H
1 /F248 /Type1 /Times-Roman /WinAnsiEncoding
1 /F250 /Type0 /ClearGothic-RegularItalic /Identity-H
2 /F13 /Type0 /ClearGothic-Bold /Identity-H
2 /F16 /Type0 /Arial-ItalicMT /Identity-H
2 /F21 /Type0 /ArialMT /Identity-H
2 /F58 /Type1 /Times-Roman /WinAnsiEncoding
2 /F59 /Type0 /ClearGothicSerialLight /Identity-H
2 /F61 /Type0 /ClearGothic-BoldItalic /Identity-H
2 /F68 /Type0 /ClearGothic-RegularItalic /Identity-H
3 /F47 /Type0 /ClearGothicSerialLight /Identity-H
3 /F49 /Type0 /ClearGothicSerialLight /Identity-H
3 /F50 /Type1 /Times-Roman /WinAnsiEncoding
3 /F52 /Type0 /ClearGothic-BoldItalic /Identity-H
3 /F54 /Type0 /TimesNewRomanPS-BoldItalicMT /Identity-H
3 /F57 /Type0 /ClearGothic-RegularItalic /Identity-H
4 /F449 /Type0 /ClearGothic-Bold /Identity-H
4 /F451 /Type0 /ClearGothicSerialLight /Identity-H
4 /F452 /Type1 /Times-Roman /WinAnsiEncoding
```

The first column gives the page number, the second the internal unique font name, the third the type of font (Type1, TrueType etc), the fourth the PDF font name, the fifth the PDF font encoding.

11.2 Reading Document Information

The `info` operation prints entries from the document information dictionary, and from any XMP metadata to standard output.

```
Scpdf -info pdf_reference.pdf
Encryption: 40bit
Linearized: true
```
The details of the format for creation and modification dates can be found in Appendix A.

By default, cpdf strips to ASCII, discarding character codes in excess of 127. In order to preserve the original unicode, add the \(-utf8\) option. To disable all postprocessing of the string, add \(-raw\). See Section 1.16 for more information.

The \(-page-info\) operation prints the page label, media box and other boxes page-by-page to standard output, for all pages in the current range.

```bash
cpdf -page-info 14psfonts.pdf
Page 1:
Label: i
MediaBox: 0.000000 0.000000 600.000000 450.000000
CropBox: 200.000000 200.000000 500.000000 500.000000
BleedBox:
TrimBox:
ArtBox:
Rotation: 0
```

Note that the format for boxes is minimum x, minimum y, maximum x, maximum y.

The \(-pages\) operation prints the number of pages in the file.

```bash
cpdf -pages Archos.pdf
8
```
11.3 Setting Document Information

The document information dictionary in a PDF file specifies various pieces of information about a PDF. These can be consulted in a PDF viewer (for instance, Acrobat).

Here is a summary of the commands for setting entries in the document information dictionary:

<table>
<thead>
<tr>
<th>Information</th>
<th>Example command-line fragment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>cpdf -set-title &quot;Discourses&quot;</td>
</tr>
<tr>
<td>Author</td>
<td>cpdf -set-author &quot;Joe Smith&quot;</td>
</tr>
<tr>
<td>Subject</td>
<td>cpdf -set-subject &quot;Behavior&quot;</td>
</tr>
<tr>
<td>Keywords</td>
<td>cpdf -set-keywords &quot;Ape Primate&quot;</td>
</tr>
<tr>
<td>Creator</td>
<td>cpdf -set-creator &quot;Original Program&quot;</td>
</tr>
<tr>
<td>Producer</td>
<td>cpdf -set-producer &quot;Distilling Program&quot;</td>
</tr>
<tr>
<td>Creation Date</td>
<td>cpdf -set-create &quot;D:19970915110347-08’00’&quot;</td>
</tr>
<tr>
<td>Modification Date</td>
<td>cpdf -set-modify &quot;D:19970915110347-08’00’&quot;</td>
</tr>
<tr>
<td>Mark as Trapped</td>
<td>cpdf -set-trapped</td>
</tr>
<tr>
<td>Mark as Untrapped</td>
<td>cpdf -set-untrapped</td>
</tr>
</tbody>
</table>

(The details of the format for creation and modification dates can be found in Appendix A. Using the date "now" uses the time and date at which the command is executed. Note also that -producer and -creator may be used to set the producer and/or the creator when writing any file, separate from the operations described in this chapter.)

For example, to set the title, the full command line would be

```bash
```

The text string is considered to be in UTF8 format, unless the -raw option is added—in which case, it is unprocessed, save for the replacement of any octal escape sequence such as \017, which is replaced by a character of its value (here, 15).

To set also any field in the XMP metadata, add -also-set-xmp. The field must exist already. To set only the field (not the document information dictionary), add -just-set-xmp instead.

11.4 XMP Metadata

PDF files can contain a piece of arbitrary metadata, often in XMP format. This is typically stored in an uncompressed stream, so that other applications can read it without having to decode the whole PDF. To set the metadata:

```bash
cpdf -set-metadata data.xml in.pdf -o out.pdf
```

To remove any metadata:
To print the current metadata to standard output:

```
cpdf -print-metadata in.pdf
```

To create XMP metadata from scratch, using any information in the Document Information Dictionary (old-style metadata):

```
cpdf -create-metadata in.pdf -o out.pdf
```

To set the XMP metadata date field, use:

```
cpdf -set-metadata-date <date> in.pdf -o out.pdf
```

The date format is defined in Appendix A.2. Using the date "now" uses the time and date at which the command is executed.

### 11.5 Upon Opening a Document

#### 11.5.1 Page Layout

The `set-page-layout` operation specifies the page layout to be used when a document is opened in, for instance, Acrobat. The possible (case-sensitive) values are:

- **SinglePage**: Display one page at a time
- **OneColumn**: Display the pages in one column
- **TwoColumnLeft**: Display the pages in two columns, odd numbered pages on the left
- **TwoColumnRight**: Display the pages in two columns, even numbered pages on the left
- **TwoPageLeft**: (PDF 1.5 and above) Display the pages two at a time, odd numbered pages on the left
- **TwoPageRight**: (PDF 1.5 and above) Display the pages two at a time, even numbered pages on the left

For instance:

```
cpdf -set-page-layout TwoColumnRight in.pdf -o out.pdf
```

NB: If the file has a valid /OpenAction setting, which tells the PDF reader to open at a certain page or position on a page, this will override the page layout option. To prevent this, use the `remove-dict-entry` functionality from Section 15.9.
11.5.2 Page Mode

The page mode in a PDF file defines how a viewer should display the document when first opened. The possible (case-sensitive) values are:

- **UseNone**: Neither document outline nor thumbnail images visible
- **UseOutlines**: Document outline (bookmarks) visible
- **UseThumbs**: Thumbnail images visible
- **FullScreen**: Full-screen mode (no menu bar, window controls, or anything but the document visible)
- **UseOC** (PDF 1.5 and above): Optional content group panel visible
- **UseAttachments** (PDF 1.5 and above): Attachments panel visible

For instance:

```bash
cpdf -set-page-mode FullScreen in.pdf -o out.pdf
```

11.5.3 Display Options

- **-hide-toolbar**: Hide the viewer’s toolbar
- **-hide-menubar**: Document outline (bookmarks) visible
- **-hide-window-ui**: Hide the viewer’s scroll bars
- **-fit-window**: Resize the document’s windows to fit size of first page
- **-center-window**: Position the document window in the center of the screen
- **-display-doc-title**: Display the document title instead of the file name in the title bar

For instance:

```bash
cpdf -hide-toolbar true in.pdf -o out.pdf
```

The page a PDF file opens at can be set using `-open-at-page`:

```bash
cpdf -open-at-page 15 in.pdf -o out.pdf
```

To have that page scaled to fit the window in the viewer, use `-open-at-page-fit` instead:
11.6 Page Labels

It is possible to add page labels to a document. These are not the printed on the page, but may be displayed alongside thumbnails or in print dialogue boxes by PDF readers. We use -add-page-labels to do this, by default with decimal arabic numbers (1,2,3...). We can add -label-style to choose what type of labels to add from these kinds:

- DecimalArabic: 1,2,3,4,5...
- LowercaseRoman: i,ii,iii,iv,v...
- UppercaseRoman: I,II,III,IV,V...
- LowercaseLetters: a,b,c,...,z,aa,bb...
- UppercaseLetters: A,B,C,...,Z,AA,BB...
- NoLabelPrefixOnly: No number, but a prefix will be used if defined.

We can use -label-prefix to add a textual prefix to each label. Consider a file with twenty pages and no current page labels (a PDF reader will assume 1,2,3... if there are none). We will add the following page labels:

i, ii, iii, iv, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, A-0, A-1, A-2, A-3, A-4, A-5

Here are the commands, in order:

```bash
cpdf -add-page-labels in.pdf 1-4 -label-style LowercaseRoman -o out.pdf
cpdf -add-page-labels out.pdf 5-14 -o out.pdf
cpdf -add-page-labels out.pdf 15-20 -label-prefix "A-" -label-startval 0 -o out.pdf
```

By default the labels begin at page number 1 for each range. To override this, we can use -label-startval (we used 0 in the final command), where we want the numbers to begin at zero rather than one.

Page labels may be removed altogether by using -remove-page-labels command. To print the page labels from an existing file, use -print-page-labels. For example:

```bash
$ cpdf -print-page-labels cpdfmanual.pdf
labelstyle: LowercaseRoman
labelprefix: None
startpage: 1
startvalue: 1
```
Chapter 11. Document Information and Metadata

```plaintext
labelstyle: DecimalArabic
labelprefix: None
startpage: 9
startvalue: 1
```
Chapter 12

File Attachments

PDF supports adding attachments (files of any kind, including other PDFs) to an existing file. The cpdf tool supports adding and removing document-level attachments — that is, ones which are associated with the document as a whole rather than with an individual page, and also page-level attachments, associated with a particular page.

12.1 Adding Attachments

To add an attachment, use the -attach-file operation. For instance,

```
cpdf -attach-file sheet.xls in.pdf -o out.pdf
```

attaches the Excel spreadsheet sheet.xls to the input file. If the file already has attachments, the new file is added to their number. You can specify multiple files to be attached by using -attach-file multiple times. They will be attached in the given order.

The -to-page option can be used to specify that the files will be attached to the given page, rather than at the document level. The -to-page option may be specified at most once.

12.2 Listing Attachments

To list all document- and page-level attachments, use the -list-attached-files operation. The page number and filename of each attachment is given, page 0 representing a document-level attachment.
Chapter 12. File Attachments

To remove all document-level and page-level attachments from a file, use the \texttt{-remove-files} operation:

\begin{verbatim}
cpdf -remove-files in.pdf -o out.pdf
\end{verbatim}

12.4 Dumping Attachments to File

The \texttt{-dump-attachments} operation, when given a PDF file and a directory path as the output, will write each attachment under its filename (as displayed by \texttt{-list-attached-files} to that directory. The directory must exist prior to the call.

\begin{verbatim}
cpdf -dump-attached-files in.pdf -o /home/fred/attachments
\end{verbatim}

Unless the \texttt{-raw} option is given, the filenames are stripped of dubious special characters before writing. It is converted from unicode to 7 bit ASCII, and the following characters are removed, in addition to any character with ASCII code less than 32:

\begin{verbatim}
/ ? < > \ : * | " ^ + =
\end{verbatim}
Chapter 13

Working with Images

```
cpdf -image-resolution <minimum resolution> in.pdf [<range>]
```

### 13.1 Detecting Low-resolution Images

To list all images in the given range of pages which fall below a given resolution (in dots-per-inch), use the `-image-resolution` function:

```
cpdf -image-resolution 300 in.pdf [<range>]
```

```
2, /Im5, 531, 684, 149.935297, 150.138267
2, /Im6, 184, 164, 149.999988, 150.458710
2, /Im7, 171, 156, 149.999996, 150.579145
2, /Im9, 65, 91, 149.999986, 151.071856
2, /Im10, 94, 60, 149.999990, 152.284285
2, /Im15, 184, 139, 149.960011, 150.672060
4, /Im29, 53, 48, 149.970749, 151.616446
```

The format is `page number, image name, x pixels, y pixels, x resolution, y resolution`. The resolutions refer to the image’s effective resolution at point of use (taking account of scaling, rotation etc).

### 13.2 Removing an Image

To remove a particular image, find its name using `-image-resolution` with a sufficiently high resolution (so as to list all images), and then apply the `-draft` and `-draft-remove-only` operations from Section 15.1
Chapter 14

Fonts

14.1 Listing Fonts

Described in Section 11.1

14.2 Copying Fonts

In order to use a font other than the standard 14 with \texttt{-add-text}, it must be added to the file. The font source PDF is given, together with the font’s resource name on a given page, and that font is copied to all the pages in the input file’s range, and then written to the output file.

The font is named in the output file with its basefont name, so it can be easily used with \texttt{-add-text}.

For example, if the file \texttt{fromfile.pdf} has a font \texttt{/GHLIGA+c128} with the name \texttt{/F10} on page 1 (this information can be found with \texttt{-list-fonts}), the following would copy the font to the file \texttt{in.pdf} on all pages, writing the output to \texttt{out.pdf}:

\begin{verbatim}
\end{verbatim}

Text in this font can then be added by giving \texttt{-font /GHLIGA+c128}. Be aware that due to the vagaries of PDF font handling concerning which characters are present in the source font, not
all characters may be available, or the encoding (mapping from input codes to glyphs) may be non-obvious.

### 14.3 Removing Fonts

To remove embedded fonts from a document, use `-remove-fonts`. PDF readers will substitute local fonts for the missing fonts. The use of this function is only recommended when file size is the sole consideration.

```bash
cpdf -remove-fonts in.pdf -o out.pdf
```

### 14.4 Missing Fonts

The `-missing-fonts` operation lists any unembedded fonts in the document, one per line.

```bash
cpdf -missing-fonts in.pdf
```

The format is

```plaintext
Page number, Name, Subtype, Basefont, Encoding
```

The operation `-embed-missing-fonts` will process the file with `gs` (which must be installed) to embed missing fonts (where found):

```bash
cpdf -embed-missing-fonts -gs gs in.pdf -o out.pdf
```
Chapter 15

Miscellaneous

cpdf -draft [-boxes] [-draft-remove-only <n>] in.pdf [<range>] -o out.pdf
cpdf -remove-all-text in.pdf [<range>] -o out.pdf
cpdf -blacktext in.pdf [<range>] -o out.pdf
cpdf -blacklines in.pdf [<range>] -o out.pdf
cpdf -blackfills in.pdf [<range>] -o out.pdf
cpdf -thinlines <minimum thickness> in.pdf [<range>] -o out.pdf
cpdf -clean in.pdf -o out.pdf
cpdf -set-version <version number> in.pdf -o out.pdf
cpdf -copy-id-from source.pdf in.pdf -o out.pdf
cpdf -remove-id in.pdf -o out.pdf
cpdf -list-spot-colors in.pdf

cpdf -remove-dict-entry in.pdf -o out.pdf

cpdf -remove-clipping in.pdf -o out.pdf

15.1 Draft Documents

The -draft operation removes bitmap (photographic) images from a file, so that it can be printed with less ink. Optionally, the -boxes option can be added, filling the spaces left blank with a crossed box denoting where the image was. This is not guaranteed to be fully visible in all cases (the bitmap may be have been partially covered by vector objects or clipped in the original). For example:

cpdf -draft -boxes in.pdf -o out.pdf

To remove a single image only, specify -draft-remove-only, giving the name of the image obtained by a call to -image-resolution as described in Section 13.1 and giving the appropriate page. For example:
To remove text instead of images, use the `-remove-all-text` operation:

```
cpdf -remove-all-text in.pdf -o out.pdf
```

### 15.2 Blackening Text, Lines and Fills

Sometimes PDF output from an application (for instance, a web browser) has text in colors which would not print well on a grayscale printer. The `-blacktext` operation blackens all text on the given pages so it will be readable when printed.

This will not work on text which has been converted to outlines, nor on text which is part of a form.

```
cpdf -blacktext in.pdf -o out.pdf
```

The `-blacklines` operation blackens all lines on the given pages.

```
cpdf -blacklines in.pdf -o out.pdf
```

The `-blackfills` operation blackens all fills on the given pages.

```
cpdf -blackfills in.pdf -o out.pdf
```

Contrary to their names, all these operations can use another color, if specified with `-color`.

### 15.3 Hairline Removal

Quite often, applications will use very thin lines, or even the value of 0, which in PDF means ”The thinnest possible line on the output device”. This might be fine for on-screen work, but when printed on a high resolution device, such as by a commercial printer, they may be too faint, or disappear altogether. The `-thinlines` operation prevents this by changing all lines thinner than `<minimal thickness>` to the given thickness. For example:

```
cpdf -thinlines 0.2mm in.pdf [<range>] -o out.pdf
```

Thicken all lines less than 0.2mm to that value.
15.4 Garbage Collection

Sometimes incremental updates to a file by an application, or bad applications can leave data in a PDF file which is no longer used. This function removes that unneeded data.

```
cpdf -clean in.pdf -o out.pdf
```

15.5 Change PDF Version Number

To change the pdf version number, use the `-set-version` operation, giving the part of the version number after the decimal point. For example:

```
cpdf -set-version 4 in.pdf -o out.pdf
```

Change file to PDF 1.4.

This does not alter any of the actual data in the file — just the supposed version number. For PDF versions starting with 2 add ten to the number. For example, for PDF version 2.0, use `-set-version 10`.

15.6 Copy ID

The `-copy-id-from` operation copies the ID from the given file to the input, writing to the output.

```
cpdf -copy-id-from source.pdf in.pdf -o out.pdf
```

Copy the id from source.pdf to the contents of in.pdf, writing to out.pdf.

If there is no ID in the source file, the existing ID is retained. You cannot use `-recrypt` with `-copy-id-from`.

15.7 Remove ID

The `-remove-id` operation removes the ID from a document.

```
cpdf -remove-id in.pdf -o out.pdf
```

Remove the ID from in.pdf, writing to out.pdf.

You cannot use `-recrypt` with `-remove-id`.
15.8 List Spot Colours
This operation lists the name of any “separation” color space in the given PDF file.

```bash
cpdf -list-spot-colors in.pdf
List the spot colors, one per line in in.pdf, writing to stdout.
```

15.9 Removing Dictionary Entries
This is for editing data within the PDF’s internal representation. Use with caution.

```bash
cpdf -remove-dict-entry /One in.pdf -o out.pdf
Remove the entry for /One in every dictionary in.pdf, writing to out.pdf.
```

15.10 Removing Clipping
The -remove-clipping operation removes any clipping paths on given pages from the file.

```bash
cpdf -remove-clipping in.pdf -o out.pdf
Remove clipping paths in in.pdf, writing to out.pdf.
```
Appendix A

Dates

A.1 PDF Date Format

Dates in PDF are specified according to the following format:

\[ D:YYYYMMDDHHmSSOHH 'mm' \]

where:

- \( YYYY \) is the year;
- \( MM \) is the month;
- \( DD \) is the day (01-31);
- \( HH \) is the hour (00-23);
- \( mm \) is the minute (00-59);
- \( SS \) is the second (00-59);
- \( O \) is the relationship of local time to Universal Time (UT), denoted by ‘+’, ‘-’ or ‘Z’;
- \( HH \) is the absolute value of the offset from UT in hours (00-23);
- \( mm \) is the absolute value of the offset from UT in minutes (00-59).

A contiguous prefix of the parts above can be used instead, for lower accuracy dates. For example:

\[ D:2014 (2014) \]
\[ D:20140103 (3rd March 2014) \]
A.2 XMP Metadata Date Format

These are the possible data formats for `set-metadata-date`:

- YYYY
- YYYY-MM
- YYYY-MM-DD
- YYYY-MM-DDTh:mmTZD
- YYYY-MM-DDTh:mm:ssTZD

where:

<table>
<thead>
<tr>
<th>YYYY</th>
<th>year</th>
</tr>
</thead>
<tbody>
<tr>
<td>MM</td>
<td>month (01 = Jan)</td>
</tr>
<tr>
<td>DD</td>
<td>day of month (01 to 31)</td>
</tr>
<tr>
<td>hh</td>
<td>hour (00 to 23)</td>
</tr>
<tr>
<td>mm</td>
<td>minute (00 to 59)</td>
</tr>
<tr>
<td>ss</td>
<td>second (00 to 59)</td>
</tr>
<tr>
<td>TZD</td>
<td>time zone designator (Z or +hh:mm or -hh:mm)</td>
</tr>
</tbody>
</table>
